SUMMARY

Software engineer with 10+ years of experience building application infrastructure and developer platforms at Vanta, LinkedIn, and PayPal. Previously Staff Software Engineer at LinkedIn. Led company-wide migrations, designed production frameworks, and guided engineers through delivery of tooling serving hundreds of developers.

EXPERIENCE

Vanta

Senior Software Engineer, Frontend Platform

2025 - Present

- Identified and led the design and rollout of **gqlts**, replacing GraphQL code generation tooling for an organization of **300 engineers**; reduced generation time from **90 seconds to 10 milliseconds** and eliminated runtime artifacts for type support, reducing the application's **compressed bundle size by approximately 40 MB**.
- Built **gqlts/mocker**, replacing pre-generated code and static mocks with schema-accurate, just-in-time network mocking; reduced test time by **85%** and caught a class of bugs previously reaching production.
- Identified the need for localization and led engineers through implementation and migration of **150,000 words** across app.vanta.com; built **i18nts**, a type-safe, tree-shakeable ICU library for browser and Node.js environments.
- Partnered with another engineer to establish **Rust** support across monorepo builds, CI, testing, dependency management, and developer setup; migrated a required ownership validation check to Rust, reducing runtime on every code change from nearly **2 minutes to 10 seconds**.

LinkedIn

Staff Software Engineer, Flagship Infrastructure

2020 - 2025

- Designed and led development of a **React Server Components router** from scratch, enabling server-driven UI, server-controlled navigation, streaming, and server-side rendering; adopted by **LinkedIn.com and all internal applications migrated from Ember to React**, working across an organization of **1,000+ engineers**.
- Led web library architecture and support for a **multi-year, company-wide REST-to-GraphQL migration**, enabling incremental migration of applications and features while supporting Ember Data, GraphQL, and existing protocols concurrently; standardized API-to-client typing and developer experience.

Senior Software Engineer, Flagship Infrastructure

2019 - 2020

- Maintained and improved core web infrastructure libraries powering LinkedIn.com and enterprise applications, managing dependency upgrades and supporting product engineers using shared infrastructure.

Software Engineer, Flagship Identity

2018 - 2019

- Reduced code across LinkedIn's profile experience by **80%** through reusable components and higher-order component patterns.
- Built the web experience for LinkedIn's **Open To** feature, including shared infrastructure that enabled other teams to extend its functionality.

PayPal

Software Engineer 2

2015 - 2018

- Developed and maintained **TyphonJS**, a mid-tier TypeScript/Node.js service, **KrakenJS**, and internal Node.js libraries supporting backend and frontend experiences across PayPal.
- Improved CI/CD performance and capabilities by adopting **Jenkins Pipelines**.
- Built localization libraries and supported **WorldServer** infrastructure on the L10n team, following work developing PayPal's guest checkout web experience.

eBay

Software Engineering Intern

2014 - 2015

- Built **Be the Customer**, an internal employee purchasing platform, alongside two other interns; continued operating and maintaining the platform during a subsequent remote internship.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Rust

Application platforms: React, React Server Components, Node.js, Ember, GraphQL, REST

Developer infrastructure: Code generation, monorepo tooling, CI/CD, Jenkins, testing infrastructure, internationalization
